

PROJECT DOCUMENTATION

Recent applications

John Biddulph · Full Stack Engineer · Worthing, UK

How each product works, what users can do, and how it is built

<https://www.jbiddulph.com>

Public product documentation only. Admin / operational portfolio fields (domains, hosting, databases, passwords, private repos) are intentionally excluded.

About this document

This PDF is the public documentation pack for the applications on **jbiddulph.com/portfolio**. For each project it covers purpose, end-to-end behaviour, architecture at a high level, user-facing capabilities, public integrations, and deployment platform notes.

It is not an operations runbook. Hosting credentials, private repository access, database connection details, SSL account notes, and other admin-only fields from the portfolio CMS are never included.

The applications

27 featured products with full public documentation.

1. Lucidity

August 2026 · Nuxt, Supabase, Prisma, API keys, headless CMS

<https://lucidity-lac.vercel.app>

A headless content management system for sites built in Nuxt, Next.js, React, Vue, or Svelte.

Purpose

Give frontend developers a CMS they can plug into Nuxt, Next.js, React, Vue, or Svelte sites without rebuilding content editing for every project.

How it works

An editor signs up, defines content schemas (for example Authors, Pages, Posts), and creates documents against those schemas. Drafts stay private until published. A consuming website authenticates with an API key and queries Lucidity for schema types, navigation pages, and collections. The CMS returns structured JSON that the frontend renders — Lucidity does not host the visitor-facing site; it is the content brain behind it.

Publishing is explicit: unpublished drafts never appear in the public query API. API keys can be rotated from the product UI so a compromised key does not require redeploying the CMS.

Architecture

- Nuxt application for the CMS UI (auth, schema builder, document editor, docs)
- Supabase for authentication and Postgres storage
- Prisma as the data access layer over content schemas and documents
- API-key-protected query endpoints for headless consumers
- Draft vs published status gating on every public read

What you can do

- Sign up / sign in to a CMS workspace
- Define custom content types and fields
- Create, edit, and publish documents
- Separate draft content from live content
- Issue and revoke API keys for frontends
- Query schema types, pages, and collections from an external site
- Read product docs from within the app

Data & access (public product)

User accounts authenticate through Supabase Auth. Content and schemas belong to the signed-in workspace. Public website reads use API keys and only receive published documents — never drafts or account details.

Integrations

Supabase Auth, Postgres via Prisma, Vercel hosting for the CMS app

Deployment notes

The CMS app is deployed as a Nuxt site on Vercel. Consuming sites call its public query API over HTTPS.

Related links

- Lucidity Demo consumer: <https://lucidity-demo.vercel.app>

2. ProbeWord

August 2026 · Nuxt, OpenAI, n8n

<https://probeword.vercel.app/>

An AI SEO brief generator: you enter a keyword and optional competitor URLs, and it returns work you can put on a page.

Purpose

Turn a keyword (and optional competitors) into an implementable SEO brief instead of another rank-tracking dashboard.

How it works

You enter a seed keyword, optionally add up to five competitor URLs, and choose a market (UK, US, AU, IE). Submitting the form triggers an n8n workflow that calls OpenAI with that context. The model returns keyword clusters (seed, long-tail, question, comparison), SERP-ready titles, meta descriptions, H1s, slugs, competitor gaps, and on-page recommendations.

The UI presents that output as a brief you can copy into a CMS or ticket. ProbeWord does not crawl your live rankings over time; each run is a fresh research pass aimed at the page you are about to write.

Architecture

- Nuxt frontend for the brief form and results view
- n8n workflow orchestration for the AI pipeline
- OpenAI for keyword and on-page generation
- Market selector that scopes language/locale assumptions

What you can do

- Enter a target keyword for a page you plan to publish
- Attach competitor URLs for gap analysis
- Pick UK / US / AU / IE market context
- Generate keyword ideas across intent types
- Receive titles, metas, H1s, and slug suggestions
- Copy on-page recommendations into your site or docs

Data & access (public product)

Runs are request/response brief generations. Any stored history is product-session data for the flow exposed by the app.

Integrations

OpenAI, n8n, Vercel

Deployment notes

Public web app on Vercel; AI work is delegated to n8n + OpenAI.

3. BonsAI

July 2026 · Next.js, TypeScript, Neon Postgres, Drizzle, OpenAI, Stripe, Netlify
<https://jbonsai.netlify.app/>

An AI plant-based food assistant that builds a week of meals, a grocery list, and leftover ideas in about 30 seconds.

Purpose

Help people eat more plant-based meals by generating a week of plans, a grocery list, and waste-reducing extras in under a minute.

How it works

A visitor answers preferences, budget, and time constraints. OpenAI returns a seven-day plant-based meal plan. The app derives a shopping list with estimated cost, grouped by category. Extra tools scan a label or menu to flag animal ingredients, suggest meals from pantry leftovers, and support Stripe billing for higher usage.

Accounts and saved plans live on Neon Postgres. The free tier covers a small number of plans per month; premium unlocks more generations. The product is a planner and assistant, not a recipe blog CMS.

Architecture

- Next.js + TypeScript web app
- Neon Postgres with Drizzle ORM
- OpenAI for meal plans and leftover ideas
- Stripe for free/premium billing
- Optional camera/upload flow for label and menu scanning
- Netlify deployment

What you can do

- Generate a personalised 7-day vegan/vegetarian plan
- Build a grocery list with estimated cost
- Scan packaging or menus for animal ingredients
- Turn leftovers into another meal idea
- Upgrade via Stripe when free-tier limits are hit
- Save plans against an account

Data & access (public product)

Accounts store preferences and generated plans in Neon. Stripe handles payment state.

Integrations

OpenAI, Stripe, Neon Postgres, Netlify

Deployment notes

Hosted on Netlify with Neon as the database and Stripe Checkout/Billing for upgrades.

4. TagFlow

July 2026 · Django, Python, API, payments

<https://www.tagflow.co.uk>

A B2B ordering layer so pet apps, hotels, events, and brands can sell NFC tags on their own sites without running a factory.

Purpose

Let pet apps, hotels, events, and brands sell NFC tags on their own sites without operating a factory or fulfilment stack.

How it works

A partner signs up free, then either embeds an iframe checkout or calls TagFlow's API from their own form. When a customer orders a tag, TagFlow takes payment and order status in the middle and routes fulfilment to a manufacturer. Partners never have to stock or ship hardware themselves.

The public site explains the model plainly: you sell tags; TagFlow and the manufacturer handle ordering logistics behind the scenes.

Architecture

- Django / Python backend with REST endpoints
- Partner accounts and embeddable checkout
- Payment capture in the TagFlow layer
- Fulfilment hand-off to manufacturer partners
- Order status tracking between buyer, partner, and fulfilment

What you can do

- Partner sign-up for free
- Embed iframe checkout on an existing site
- Place orders through an API from a custom form
- Track payment and fulfilment status
- Sell NFC hardware as an add-on without manufacturing it

Data & access (public product)

Partner accounts authenticate to manage embeds/API access. Customer order data is processed for payment and fulfilment only as exposed by the product flows.

Integrations

Payment provider, Manufacturer fulfilment, Partner embed/API

Deployment notes

Public marketing + app site at tagflow.co.uk.

5. UKPubs

September 2025 (actively maintained 2026) · Nuxt, Supabase, Prisma, location services (frontend repo: [johnpyfe](https://ukpubs.co.uk/))
<https://ukpubs.co.uk/>

A UK-wide pubs and venues directory with search, news, events, and location-based lists.

Purpose

Help people find pubs and venues across the UK, plus industry news and what's on.

How it works

Visitors search by town, county, or pub name. The directory ranks places by listing density, highlights seaside towns, and surfaces pubs within a mile of Premier League stadiums. Editorial content covers openings, closures, and venue events such as gigs and comedy.

The stack has evolved over time; the current public product is a Nuxt frontend reading from Supabase/Prisma-backed data with location-aware lists.

Architecture

- Nuxt frontend for search and listing pages
- Supabase/Postgres data for venues and content
- Prisma data access
- Location-based queries (town, coast, stadium proximity)
- News and events content alongside directory data

What you can do

- Search pubs by town, county, or name
- Browse seaside and stadium-neighbourhood lists
- Read pub-industry news
- See upcoming gigs and comedy at venues
- Explore ranked towns/counties by listing count

Data & access (public product)

Public browse is open. Any contribution or account features use the product's own sign-in.

Integrations

Supabase, Location/geocoding services

Deployment notes

Public site at ukpubs.co.uk.

6. Zap Task

September 2025 · Laravel, Vue 3, TypeScript, Tailwind, Supabase realtime (repo: taskit)

<https://www.zaptask.co.uk>

A simplified Jira-style task manager: Kanban boards, projects, assignees, and workflow without enterprise complexity.

Purpose

Give small teams a lighter Kanban/task tool than full Jira — projects, boards, assignees, and workflow without enterprise weight.

How it works

A user creates isolated project boards (key, colour, description). Inside a board, cards move across To Do / In Progress / Done with drag and drop. Cards carry priority, type (bug, feature, story, epic), tags, assignee, due dates, and story points. Search and filters narrow the board; a stats strip summarises totals, in-progress, done, and overdue work.

Realtime updates use Supabase. Tenants can work on subdomains while the core product stays at zaptask.co.uk.

Architecture

- Laravel backend
- Vue 3 + TypeScript + Tailwind board UI
- Supabase realtime for live board updates
- Multi-project boards with card metadata
- Subdomain-per-tenant routing pattern

What you can do

- Create project boards with keys and colours
- Drag cards between workflow columns
- Assign people, tags, estimates, and due dates
- Filter and search the board
- View progress stats and overdue work
- Use dark mode
- Work from a tenant subdomain workspace

Data & access (public product)

Each account's projects are isolated. Tenant subdomains serve the same product shell against that workspace's data.

Integrations

Supabase realtime, Laravel session/auth

Deployment notes

Primary app at zaptask.co.uk with tenant hosts such as johnb.zaptask.co.uk.

7. ZapTask — subdomain dashboard

July 2026 · Same Zap Task platform, tenant subdomain

<https://johnb.zaptask.co.uk>

A live tenant of Zap Task, showing how each customer gets their own dashboard on a subdomain.

Purpose

Demonstrate Zap Task's multi-tenant model: each customer works in their own subdomain workspace.

How it works

johnb.zaptask.co.uk loads the same Zap Task application shell against a dedicated tenant workspace. Cookie consent and board tools behave like the main product, but the URL and data scope belong to that tenant. It is not a separate codebase.

Architecture

- Same Zap Task platform
- Host-based tenant resolution
- Shared UI with per-tenant data isolation

What you can do

- Sign into a personal/team workspace on a dedicated host
- Use Kanban/task tools without sharing another tenant's board

Data & access (public product)

Authentication and board data are scoped to the tenant resolved from the hostname.

Integrations

Zap Task platform

Deployment notes

Tenant subdomain on the Zap Task deployment.

8. Old Skool Vibe Dev

July 2026 · React, Vite, Supabase, Resend

<https://www.oldschoolvibe.dev/>

A services site advertising freelance work: React, Vue, Nuxt, Laravel, Python, and AI-assisted development.

Purpose

Generate freelance enquiries for React, Vue, Nuxt, Laravel, Python, and AI-assisted build work.

How it works

Each service page speaks to a buyer looking for a specific skill. An enquiry form stores the submission and emails John via Resend. There is no end-customer SaaS account area — the site is lead generation for contract work.

Architecture

- React + Vite marketing site
- Supabase table for enquiry rows
- Resend transactional email on submit

What you can do

- Browse stack-specific service pages
- Submit a project enquiry
- Receive confirmation that the message was stored and emailed

Data & access (public product)

Enquiry payloads are form submissions stored for follow-up.

Integrations

Supabase, Resend

Deployment notes

Public site at oldschoolvibe.dev.

9. Dog Healthy

October 2025 · Nuxt, Supabase, Prisma, NFC/QR, SMS alerts, affiliate food data

<https://doghealthy.co.uk>

A UK dog-owner hub: health records, vaccinations, food matching, walks, and NFC/QR tags if a dog is lost.

Purpose

Give UK dog owners one place for health records, food matching, walks, and recovery if a dog goes missing.

How it works

Owners create dog profiles (breed, photos, microchip). They log medical history, vaccinations with reminders, medications, vet appointments, contacts, and weight charts. A food quiz recommends products by breed, age, diet, and budget with affiliate comparison.

NFC/QR tags encode the DogHealthy profile. A finder or sitter can start a GPS walk, check in/out, or report a lost dog so the owner receives an SMS with contact and location. The service is UK-oriented and free to start.

Architecture

- Nuxt application for owner dashboards and public tag flows
- Supabase/Prisma for profiles and health records
- NFC/QR deep links into dog profiles
- SMS alerts for lost-dog reports
- Affiliate-oriented food recommendation data

What you can do

- Create and manage dog profiles
- Log jabs, meds, weight, and vet details with reminders
- Run a food-matching quiz
- Encode a profile onto an NFC/QR collar tag
- Let a finder start a walk or report a lost dog
- Receive SMS alerts with location context

Data & access (public product)

Owner accounts control their dogs' records. Public tag links expose only the recovery/check-in flows designed for finders — not private medical edit controls.

Integrations

Supabase, SMS provider, NFC/QR, Affiliate food feeds

Deployment notes

Public product at doghealthy.co.uk.

10. Trailsz (iOS)

May 2026 · iOS, maps, navigation

<https://apps.apple.com/gb/app/trailsz/id6763732208>

An iPhone app for discovering, creating, and sharing walking, cycling, and driving trails.

Purpose

Help people discover, create, and share walking, cycling, and driving trails with notes and community reports.

How it works

Users browse existing trails or plot their own on the map, drop notes, add mystery stops, and read community reports. The app is a navigation companion for getting from A to B along a shared or homemade route, distributed through the App Store.

Architecture

- Native iOS client
- Map/navigation stack for trail following
- User-generated trails, notes, and reports

What you can do

- Follow a trail with notes and stops
- Publish a route for others
- Report trail issues to the community
- Cover walking, cycling, and driving

Data & access (public product)

App Store account + in-app identity as provided by the product.

Integrations

Apple App Store, Device maps/location

Deployment notes

Distributed via the App Store listing.

11. ScanAJoke

June–July 2026 · Vite/TypeScript, in-browser OCR, OpenAI

<https://scanajoke-9g4j.vercel.app/>

Point a camera at real-world text; the browser reads it and OpenAI turns it into a pun.

Purpose

Turn real-world text into a quick pun using on-device OCR plus OpenAI.

How it works

The user scans a receipt, sign, page, note, or screenshot (or uploads an image). OCR runs in the browser. Extracted text is shown for correction, then sent to OpenAI for a short joke or pun. Example text is available if the camera is unavailable. There is no heavy account system on the landing flow — scan, review, punchline.

Architecture

- Vite + TypeScript single-page app
- In-browser OCR pipeline
- OpenAI for joke generation
- Optional upload path alongside camera capture

What you can do

- Photograph or upload text-bearing images
- Review and edit OCR output
- Generate a one-off pun from that text
- Try example text without a camera

Data & access (public product)

Primarily ephemeral client-side flow; OpenAI receives only the text you submit for the joke.

Integrations

OpenAI, Vercel

Deployment notes

Web app on Vercel.

12. Ball-Z (SiteForge)

July 2026 · Next.js, Supabase Auth, AI code generation

<https://ball-z-phi.vercel.app/>

A chat-driven website builder: you describe a site, then keep asking for changes until the live preview and generated Next.js code look right.

Purpose

Generate and iterate a landing page through chat, then export real Next.js source.

How it works

After optional Supabase sign-in, you describe a site in the SiteForge builder chat. The system drafts a landing page (demo default: a fitness studio), shows desktop/mobile preview, and emits files such as layout, page, CSS, and a client component. Follow-up messages restyle themes, rewrite copy, or move sections. The app is a generator — not a hosted CMS for the finished business's ongoing content.

Architecture

- Next.js application with builder dashboard
- Supabase Auth for private projects
- AI code generation producing real Next.js files
- Live preview (desktop/mobile) of generated UI

What you can do

- Describe a business and receive a landing-page draft
- Iterate in chat (theme, copy, section order)
- Preview desktop and mobile layouts
- Inspect and export generated Next.js source
- Keep projects private when signed in

Data & access (public product)

Optional Supabase Auth scopes saved projects to the signed-in user.

Integrations

Supabase Auth, AI code generation, Vercel

Deployment notes

Public builder on Vercel.

13. HelloJ

May 2026 · Node/JavaScript, image generation, Vinted browse

<https://helloj.vercel.app/>

An AI virtual try-on tool: your photo plus a garment (upload, camera, or Vinted) produces a styled preview.

Purpose

Preview how a garment might look on you using AI virtual try-on.

How it works

You supply a person photo and a reference outfit from upload, camera, or Vinted category browse. Controls adjust item type, output aspect ratio, background retention, and garment-change strength. The server returns a generated image, download, and history of previous results. It visualises fashion; it does not run checkout.

Architecture

- Node/JavaScript web app
- Image generation pipeline on the server
- Vinted browse as one garment source
- Client controls for strength and framing

What you can do

- Upload or capture a person photo
- Choose a garment from upload, camera, or Vinted
- Tune background and change strength
- Download generated try-on images
- Browse previous results in history

Data & access (public product)

Generated images and history follow the product's session/account model.

Integrations

Image generation API, Vinted browse, Vercel

Deployment notes

Hosted on Vercel.

14. hangn.art

2026 · Realtime collaborative canvas, gallery

<https://www.hangn.art/>

A live shared sketchbook: up to four people draw on one sheet at the same time, then save it to a gallery.

Purpose

Let up to four people draw on one shared sheet in realtime, then save finished work to a gallery.

How it works

Open a sketch, set your name, share the URL. Everyone on that sheet sees strokes live. Tools include multiple pens plus shapes and text that can be moved and restyled. When the group is happy, the drawing is saved to a public gallery shelf.

Architecture

- Realtime collaborative canvas
- Presence capped at four concurrent drawers
- Public gallery of finished sketches

What you can do

- Start a sheet and invite others with a link
- Draw together live
- Use pens, shapes, and text tools
- Save to the public gallery
- Browse finished sketches

Data & access (public product)

Participants join a sheet via shared URL; gallery items are public once saved.

Integrations

Realtime transport for stroke sync

Deployment notes

Public site at hangn.art.

15. Coastrz

May 2025 · Ecommerce, custom design, web platform (TypeScript + Python repos)

<https://www.coastrz.com>

An online shop for drinks coasters, including custom and branded designs.

Purpose

Sell ready-made and custom/branded drinks coasters online.

How it works

Shoppers browse physical coaster designs (wood, ceramic, and similar) and can order custom or branded sets. Related experiments include album-cover coaster sets paired with Spotify. The customer job is product browsing and ordering.

Architecture

- Ecommerce storefront
- Custom design ordering flow
- TypeScript + Python supporting services/repos as applicable

What you can do

- Browse ready-made designs
- Order custom or branded sets
- Checkout for physical fulfilment

Data & access (public product)

Standard ecommerce customer/order data for the storefront only.

Integrations

Ecommerce/payments, Spotify-related experiments where enabled

Deployment notes

Public shop at coastrz.com.

16. Tripz (iOS)

July 2025 · iOS, maps, accounting-style logs

<https://apps.apple.com/gb/app/tripz/id6745882589>

An iPhone app for logging trips with live maps, earnings, and spending — aimed at drivers who need income and expense records.

Purpose

Let drivers log work trips with live maps, earnings, and spending for income/expense records.

How it works

A driver starts a trip, watches it on a live map, and logs what was earned versus spent. Reports and per-journey controls support private-hire style record keeping. It is an operational log, not a holiday planner.

Architecture

- Native iOS app
- Maps for live trip plotting
- Earnings and expense ledgers
- Reporting views

What you can do

- Start and track a trip on a map
- Log earnings and costs
- Review or export activity reports
- Use dark mode

Data & access (public product)

Trip and money logs belong to the signed-in app user.

Integrations

Apple App Store, Device location/maps

Deployment notes

Distributed on the App Store.

17. Tripz (web)

July 2025 · Nuxt, Tailwind, Supabase, Mapbox

<https://ridez-66c2d14c6c66.herokuapp.com/>

The browser version of Tripz: same idea as the iPhone app, on the web with Mapbox.

Purpose

Offer the Tripz trip/earnings workflow in a browser with Mapbox.

How it works

Drivers who prefer a laptop log trips, earnings, and expenditure against a Mapbox map without installing the iOS app. Product purpose matches Tripz on the App Store.

Architecture

- Nuxt + Tailwind web client
- Supabase backend services
- Mapbox for routes/maps

What you can do

- Log trips from a desktop browser
- See routes and money against a Mapbox map

Data & access (public product)

Authenticated web users own their trip logs.

Integrations

Supabase, Mapbox, Heroku hosting

Deployment notes

Web deployment on Heroku.

18. Schools (iOS)

July 2025 · iOS, maps, school directory

<https://apps.apple.com/gb/app/schools/id6746278412>

An iPhone directory to discover, search, and review schools near you.

Purpose

Help parents discover, search, and review schools near them.

How it works

Parents look up schools by area, read information, leave reviews, and compare options on a map. It is a local directory experience, not a school MIS or homework platform.

Architecture

- Native iOS client
- Map-centric school directory
- Reviews layered on school records

What you can do

- Search schools by area
- Read and write reviews
- Compare options on a map

Data & access (public product)

Reviews are tied to the app user identity provided by the product.

Integrations

Apple App Store, Maps

Deployment notes

App Store distribution.

19. CarScan

January 2026 · Next.js, Supabase, in-browser OCR, DVLA VES

<https://carscan-zeta.vercel.app/>

Point the camera at a number plate; the app reads it locally and looks the vehicle up with DVLA.

Purpose

Read a UK number plate in-browser and look the vehicle up with DVLA.

How it works

The rear camera (or a manual registration field) captures a plate. OCR runs locally, validates format, then calls DVLA Vehicle Enquiry Service. Results can be saved and shared with location. It is a lookup tool, not an enforcement ANPR system.

Architecture

- Next.js web app
- In-browser OCR for plates
- DVLA VES lookup
- Supabase for saved scans when enabled

What you can do

- Frame a plate or type a registration
- Confirm OCR'd text before lookup
- View DVLA vehicle data
- Save or share a scan with location

Data & access (public product)

Saved scans belong to the product user/session. DVLA is queried with the registration only.

Integrations

DVLA Vehicle Enquiry Service, Supabase, Vercel

Deployment notes

Public web app on Vercel.

20. onTrack

October 2025 · Next.js, Mapbox, TfL data, GeoJSON, geocoding
<https://mappingme.netlify.app/>

A London movement map: plan public-transport journeys and overlay nearby pubs, restaurants, and events.

Purpose

Plan London public-transport journeys and see nearby pubs, restaurants, and events on one map.

How it works

After sign-in, the map layers TfL stations, entrances, platforms, accessible paths, tube, rail, and venues. Journey planning sits beside “what is around me” overlays rather than cloning TfL one-for-one. Location features require authentication.

Architecture

- Next.js map application
- Mapbox rendering
- TfL open data overlays
- GeoJSON venue layers
- Geocoding for search

What you can do

- View tube/rail infrastructure live
- Plan a journey across London
- Discover pubs, restaurants, or events near the route

Data & access (public product)

Signed-in users can enable location-aware features; map tiles/data are read-only overlays.

Integrations

Mapbox, TfL data, Netlify

Deployment notes

Public app on Netlify.

21. Worthing Roads

September 2025 · Next.js / TypeScript quiz, maps, local knowledge bank

<https://worthingroads.netlify.app>

A revision quiz for the Worthing District private-hire knowledge test: junctions, roads, and points of interest.

Purpose

Revise for the Worthing District private-hire knowledge test with exam-style junction and POI quizzes.

How it works

Multiple parts cover junction questions (hundreds across parts) plus a POI quiz about local landmarks. Town context can come from search, geolocation, or a map test. Quizzes are timed and scored. The question bank is built around the real licensing exam, not trivia.

Architecture

- Next.js / TypeScript quiz app
- Local knowledge question bank
- Map-assisted road finding
- Timed scoring UX

What you can do

- Drill junction knowledge in exam-style parts
- Take a POI landmark quiz
- Use the map test to find Worthing roads
- See scores and completion feedback

Data & access (public product)

Quiz progress is client/product state.

Integrations

Maps/geolocation, Netlify

Deployment notes

Web app on Netlify.

22. PRD Generator

July 2025 · Next.js, AI document generation

<https://prds.netlify.app>

Type a product idea (or pick a template) and generate a Product Requirements Document with features, specs, and user flows.

Purpose

Produce a structured Product Requirements Document from a plain-language product idea.

How it works

You describe an app or pick/regenerate a template. The model returns features, specs, and user flows aimed at web and mobile products. Output is documentation for a team to implement — not running software.

Architecture

- Next.js UI for prompts and templates
- AI document generation pipeline

What you can do

- Describe an idea in plain language
- Start from or regenerate templates
- Download/share a structured PRD

Data & access (public product)

Prompt/result handling follows the public app flow only.

Integrations

AI text generation, Netlify

Deployment notes

Public site on Netlify.

23. Street Party

May 2025 · Next.js, maps

<https://street-party.uk>

A neighbourhood tool for organising a street party: draw the houses involved, set a passcode, and let residents join.

Purpose

Help neighbours organise a street party by mapping houses and joining with a passcode.

How it works

An organiser draws around buildings on a map, names the event, sets times, uploads a picture, and chooses a passcode. Residents pick the party, enter the passcode, select their building, and add household members. It is event coordination, not a general social network.

Architecture

- Next.js application
- Map drawing for included houses
- Passcode-gated resident join flow

What you can do

- Organisers map which houses are included
- Set event details and a passcode
- Residents join and register household members

Data & access (public product)

Event membership is gated by the organiser passcode; household details belong to that event.

Integrations

Maps

Deployment notes

Public site at street-party.uk.

24. Pin Spots

September 2024 · Next.js, maps

<https://pinspots.co.uk>

A simple map where people drop pins on places that matter to them.

Purpose

Provide a lightweight map for dropping pins on places that matter.

How it works

Users pin spots of interest and browse pins others have marked. It is personal geo-bookmarking, not a full listings directory.

Architecture

- Next.js map UI
- Simple pin storage/retrieval

What you can do

- Drop a pin on a location
- Browse spots other people have marked

Data & access (public product)

Pins are public map markers as exposed by the product.

Integrations

Maps

Deployment notes

Public site at pinspots.co.uk.

25. Stop Charge

July 2024 · Nuxt 3, Mapbox, Supabase, Prisma, geolocation

<https://stopcharge.co.uk/map>

A UK EV charging map: find chargers near you and measure distance between two points.

Purpose

Find UK EV chargers and measure distance between map points.

How it works

The map shows charging locations. You can use current location to find the nearest charger, then select two points to see distance in km or miles. It locates and measures — it does not book or pay for charging sessions.

Architecture

- Nuxt 3 map application
- Mapbox rendering
- Supabase/Prisma-backed charger data where used
- Browser geolocation

What you can do

- Browse chargers on a national map
- Find the nearest point from the current location
- Measure distance between two selected points

Data & access (public product)

Map usage is public; location is only used in the browser when permitted.

Integrations

Mapbox, Supabase, Geolocation

Deployment notes

Public map at stopcharge.co.uk/map.

26. Melvyn Biddulph

March 2023 (maintained) · Art gallery / portfolio site

<https://melvbiddulph.art>

An online gallery for paintings and biography of Melvyn Biddulph (Rochdale / St Martins), with enquiries handled by John.

Purpose

Present Melvyn Biddulph's paintings and biography and route purchase enquiries.

How it works

Visitors read the artist story (Rochdale College of Art, St Martins, later textile design, 2018 solo show) and browse works. Enquiries quote a piece ID to John. It is a family artist archive and sales enquiry front — not a social art network.

Architecture

- Art gallery / portfolio website
- Work listings with enquiry-by-ID flow

What you can do

- Read biography and interview material
- Browse works
- Enquire about a specific piece ID

Data & access (public product)

Public gallery content; enquiries are messages about listed works.

Integrations

Standard web hosting/email enquiry path

Deployment notes

Public site at melvbiddulph.art.

27. jbiddulph.com (this site)

Ongoing, 2024–2026 · Nuxt 3, Vue, Tailwind, Prisma, Supabase, Pinia

<https://www.jbiddulph.com>

Personal site, CV, services, docs, blog, and the CMS that publishes the portfolio this PDF is based on.

Purpose

Personal site for CV, services, docs, blog, and the public portfolio of products listed in this PDF.

How it works

Public pages cover home, portfolio grid, project detail (including these write-ups), CV with PDF download, services with enquiry form, docs, and blog. Visitors can switch design themes. Chat and enquiry APIs sit alongside the content site.

This document describes the public product experience only. Site editing tools used to maintain content are intentionally out of scope for this public document.

Architecture

- Nuxt 3 + Vue + Tailwind public site
- Prisma + Supabase-backed content APIs for public pages
- Pinia/client state where needed
- Project detail pages enriched from this documentation set

What you can do

- Browse live projects and open each product URL
- Read project documentation pages
- Read or download the CV
- Send a services enquiry
- Read docs and blog posts
- Switch visitor-facing design themes

Data & access (public product)

Public content is readable without an account. Services enquiries are form submissions. Site-editing tooling is not part of this public PDF.

Integrations

Supabase, Prisma, Optional analytics, Chat webhook for the public assistant

Deployment notes

Public site at [jbiddulph.com](https://www.jbiddulph.com).

Appendix — related public experiments

Companion demos and experiments that support the main portfolio story. Same public-only rule applies.

1. LocalSEO

2025–2026 · See live project

<https://localseo-ten.vercel.app>

Google Maps ranking intelligence by postcode, not city averages: heatmaps, competitor movement, multi-location weekly alerts, and shareable reports for local operators.

Purpose

Google Maps ranking intelligence by postcode, not city averages: heatmaps, competitor movement, multi-location weekly alerts, and shareable reports for local operators.

How it works

Google Maps ranking intelligence by postcode, not city averages: heatmaps, competitor movement, multi-location weekly alerts, and shareable reports for local operators.

This appendix entry summarises a public experiment or companion repo that supports the main portfolio story. Deeper product UI docs live on the linked URL when the deployment is active.

Architecture

- Public web or repo artefact linked above

What you can do

- Open the linked URL or repository to explore the working prototype

Data & access (public product)

Public prototype or open repository.

Deployment notes

See the linked public URL or GitHub repository.

2. Lucidity Demo

2025–2026 · See live project

<https://lucidity-demo.vercel.app>

A Nuxt consumer of Lucidity. It reads schema types, builds navigation from Pages, and loops included collections (for example posts on a Blog page) through the Lucidity query API.

Purpose

A Nuxt consumer of Lucidity. It reads schema types, builds navigation from Pages, and loops included collections (for example posts on a Blog page) through the Lucidity query API.

How it works

A Nuxt consumer of Lucidity. It reads schema types, builds navigation from Pages, and loops included collections (for example posts on a Blog page) through the Lucidity query API.

This appendix entry summarises a public experiment or companion repo that supports the main portfolio story. Deeper product UI docs live on the linked URL when the deployment is active.

Architecture

- Public web or repo artefact linked above

What you can do

- Open the linked URL or repository to explore the working prototype

Data & access (public product)

Public prototype or open repository.

Deployment notes

See the linked public URL or GitHub repository.

3. Air Charter Broker CRM

2025–2026 · See live project

<https://air-charter-broker-crm.vercel.app>

A Next.js + Supabase CRM for air-charter brokers: companies, contacts, and inquiries behind sign-in, with RLS and ShadCN UI.

Purpose

A Next.js + Supabase CRM for air-charter brokers: companies, contacts, and inquiries behind sign-in, with RLS and ShadCN UI.

How it works

A Next.js + Supabase CRM for air-charter brokers: companies, contacts, and inquiries behind sign-in, with RLS and ShadCN UI.

This appendix entry summarises a public experiment or companion repo that supports the main portfolio story. Deeper product UI docs live on the linked URL when the deployment is active.

- Public web or repo artefact linked above

What you can do

- Open the linked URL or repository to explore the working prototype

Data & access (public product)

Public prototype or open repository.

Deployment notes

See the linked public URL or GitHub repository.

4. TalkToMe

2025–2026 · See live project

<https://github.com/jbiddulph/talktome>

AI meeting notes: record audio, transcribe with Whisper, generate a summary, file meetings in folders, and download an ICS calendar event. Next.js + Capacitor for iOS.

Purpose

AI meeting notes: record audio, transcribe with Whisper, generate a summary, file meetings in folders, and download an ICS calendar event. Next.js + Capacitor for iOS.

How it works

AI meeting notes: record audio, transcribe with Whisper, generate a summary, file meetings in folders, and download an ICS calendar event. Next.js + Capacitor for iOS.

This appendix entry summarises a public experiment or companion repo that supports the main portfolio story. Deeper product UI docs live on the linked URL when the deployment is active.

Architecture

- Public web or repo artefact linked above

What you can do

- Open the linked URL or repository to explore the working prototype

Data & access (public product)

Public prototype or open repository.

Deployment notes

See the linked public URL or GitHub repository.

5. Camme / Exhibitionist

2026 · FastAPI, Go, LiveKit, Redis, Stripe / IAP

<https://camme.vercel.app>

Social cam and live broadcast/chat foundation; exhibitionist.me is the public live product direction of the same idea.

Purpose

Power live video chat/broadcast experiences with realtime media, tips, and chat.

How it works

Broadcasters and viewers connect through a web app backed by FastAPI and Go services. LiveKit handles media. Redis supports realtime state. Stripe and in-app purchases cover tips and unlocks. exhibitionist.me is the public-facing live broadcast/chat direction built on this foundation.

Architecture

- FastAPI + Go application services
- LiveKit for realtime video
- Redis for ephemeral realtime state
- Stripe / IAP for tips and purchases

What you can do

- Watch or run a live broadcast with realtime chat
- Support a broadcaster through tips and purchases

Data & access (public product)

Viewer/broadcaster accounts as exposed by the product.

Integrations

LiveKit, Redis, Stripe, IAP

Deployment notes

Public web deployments for Camme / Exhibitionist properties.

6. Ask Midwife

2025–2026 · See live project

<https://askmidwife.vercel.app>

A Next.js app for maternity questions (live at askmidwife.vercel.app). Companion to the other 2026 consumer experiments on Vercel.

Purpose

A Next.js app for maternity questions (live at askmidwife.vercel.app). Companion to the other 2026 consumer experiments on Vercel.

How it works

A Next.js app for maternity questions (live at askmidwife.vercel.app). Companion to the other 2026 consumer experiments on Vercel.

This appendix entry summarises a public experiment or companion repo that supports the main portfolio story. Deeper product UI docs live on the linked URL when the deployment is active.
